Exfil Everything: A Year of Stealing Data from AI Agents

Speaker(s): [Ads Dawson](#) · [Mike Takahashi](#)

Location	Time	Duration
Bug Bounty Village (W206-W207)	02:00 PM - 02:30 PM	30 mins

Abstract:

For two decades, XSS was the king of data theft — exploiting trust boundaries in a victim's browser to exfiltrate sensitive data and perform malicious actions. AI-powered interfaces have introduced new ways to deliver XSS to victims alongside an entirely new bug class that has emerged as the most impactful vulnerability pattern in modern AI applications. The parallels between XSS and AI data exfiltration are striking — both exploit trust boundaries to force a system into performing unintended actions on behalf of a victim but the attack surface in AI is broader, spanning web interfaces, mobile apps, wearables, and any client consuming agent output. The exfiltration channels are diverse: markdown image rendering, iframe and HTML tag injection, sandbox escapes, native platform connectors, network connectivity tools, javascript: URI schemes, link unfurling side channels, MCP server poisoning, and multi-step agent tool-abuse chains. In this talk, two bug hunters who've spent the past year exploiting these vulnerabilities across production applications break it down and walk through real attack chains, demonstrate how we bypass common mitigations and share the bypass techniques we've developed. We'll cover how to threat model AI applications, identify viable attack paths, and select delivery mechanisms to weaponize end-to-end exploits. Beyond offense, we'll discuss the mitigations we've encountered, what actually works, what doesn't, and emerging trends in agentic AI and autonomous tool use mean for the next wave of vulnerabilities hunters should be watching for. Leave with: (1) a clear mental model of AI data exfiltration as a bug class and how it relates to familiar web primitives, (2) concrete attack techniques and bypass methods, (3) practical threat modeling for identifying exfil

paths in AI agents and applications, and (4) visibility into upcoming trends and bug classes they should be hunting as AI systems gain more autonomy and connectivity.

Bots, Bounties, and Bullshit: An Honest Panel on AI in Hacking

Panelists: [Vitor Falcao Habibe Costa](#) · [Joey Melo](#) · [Dustin Farley](#) · [Ads Dawson](#)

Moderator: [Ben Sadeghipour](#)

Location

Bug Bounty Village (W206-W207)

Time

02:30 PM - 04:00 PM

Duration

90 mins

Abstract:

AI has landed on both sides of the bug bounty table at once. Hackers are being told to use it, programs are drowning in the slop it produces, and a whole new attack surface, agents, RAG pipelines, and tool-calling LLMs, just showed up in scope.

This panel brings together working hackers who run AI in their daily flow, LLM security researchers who break AI for a living, and a moderator who has spent a decade in the scene. In 45 minutes they cut through the hype and get specific: which parts of recon, review, and reporting AI actually handles, how to hack the LLM-backed apps now in scope and get paid for it, and why the real edge isn't ChatGPT but the private agents and skills hackers are quietly building to turn one good idea into a hundred bugs.
